FIGHTING FOR BREATH IN SOUTH SUDAN
A call to action on childhood pneumonia

WHY ARE CHILDREN DYING OF PNEUMONIA AROUND THE WORLD?

- A child who is severely malnourished is four times more likely to die from pneumonia. Globally, 52 million children suffer from wasting, and they face grave health risks.
- Pneumococcal vaccines (PCVs) could prevent most bacterial pneumonia cases, but 170 million children under two in developing countries are unimmunised.
- One-third of children with pneumonia-like symptoms do not seek appropriate care.
- Antibiotics which could prevent 70% of all pneumonia deaths, costing just $0.50 on average, are frequently not accessible and often unavailable.
- Poor children are most at risk from pneumonia but health systems disproportionately provide for wealthier children.

Pneumonia claims the lives of more children around the world than any other infectious disease. The vast majority of those killed by pneumonia are poor and living in low and middle income countries.

920,000 children under five died of pneumonia in 2015. That’s two fatalities every minute of every day - more than diarrhea, malaria and measles combined. Most of the deaths happen in South Asia and sub-Saharan Africa. Over 80% occur among children under two, many of them in the first weeks of life. This is a disease that leaves children gasping for breath and fighting for life.

Strengthening Primary Health Care (PHC)

Every nation should make it a priority to ensure strong, accessible primary health care systems for all communities. For effective prevention, early diagnosis, and treatment of pneumonia, health care systems must be free for patients. They must have trained community health workers; adequately supplied facilities; cold chain and transport for vaccines so everyone can have access to immunisation; and referral systems must be swift for children with severe pneumonia. Health plans should also include interventions to improve the overall health of children. Their vulnerability to pneumonia can be reduced by combating undernutrition, by protecting, promoting, and supporting exclusive breastfeeding, and by encouraging care seeking behaviour.

Progressing towards Universal Health Coverage (UHC) to combat pneumonia

Pneumonia cannot be treated in isolation. Tackling pneumonia requires a strong and accessible health system that reaches the most disadvantaged children. Governments need to make quality primary health care for every community the foundation and priority for progressing towards UHC. All countries, irrespective of income level, can and should make progress towards UHC; expanding reach, services, and the extent of financial protection for the poorest people/families. The path countries take will differ but all must ensure equitable access without discrimination. Pneumonia prevention, management and treatment should be part of an integrated maternal and child health continuum of care which can be delivered by a strong PHC system that should be the foundation and priority for UHC.

RECOMMENDATIONS FOR SOUTH SUDAN

- Resource and implement the National ICCM Guidelines and improve training and equipping of community based distributors.
- Improve access to water, sanitation, and hygiene at the community level.
- Increase national investment in immunisation infrastructure to expand reach and quality of delivery, with a sharpened focus on equity.
- Reduce vulnerability to pneumonia by improving breastfeeding and addressing stunting and wasting in children under five.
- Mobilise support and resources for strengthening the national health system and ensuring progress towards universal health coverage.
- Improve procurement and supply of life saving commodities for pneumonia at the community and facility levels.
### Key Pneumonia Facts for South Sudan

- **Pneumonia killed 8,268 children in 2015** – more than 1 child every hour.
- **12,901 children under two are not immunised with PCV in 2016.**
- **If current trends continue, 3,496 children will die from pneumonia in 2030.**

### UHC to Combat Pneumonia

<table>
<thead>
<tr>
<th>Health Outcomes</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>25 per 1000 live births</td>
<td>Sustainable Development Goals (SDG) target rate for under five deaths by 2030.</td>
</tr>
<tr>
<td>3 per 1000 live births</td>
<td>Target pneumonia death rate for under fives by 2025, as envisaged under the Global Action Plan for Pneumonia and Diarrhoea (GAPPD).</td>
</tr>
</tbody>
</table>

### Nutrition

- As per the 2025 targets set in the 2012 World Health Assembly Resolution, the vital steps towards ending malnutrition by 2030 are:
  - **40% reduction** in stunting in children under five.
  - **5% or less** wasting prevalence in children under five.
  - **50% exclusive breastfeeding rate** for the first 6 months.

### Immunisation

- **90% national and at least 80% district or equivalent administrative unit coverage** for vaccination by 2020 as per the Global Vaccine Action Plan (GVAP).
- **Hib (Haemophilus influenzae type B)** vaccine and **PCV** included in the national immunisation programme.

### Paying for Healthcare

- **$86** is the minimum recommended government spend/person/year to provide essential health services as per WHO recommendations.
- **5%** is the minimum recommended government spend on health as % of GDP as per WHO recommendations.

### Spotlight on South Sudan

- **91 per 1000 live births, under five mortality rate** in South Sudan in 2016.
- **19 per 1,000 live births, under five mortality rate** in South Sudan due to pneumonia in 2015.
- **31%** stunting rate in 2010. To remain on track to achieve SDG 2 in 2030, South Sudan needs to reduce stunting rates to **19%** by 2025.
- **23%** wasting prevalence in children under five in 2010.
- **45%** exclusive breastfeeding rate in 2010.
- **26%** national rate in 2016 based on DTP3 coverage.
- **26%** Hib vaccine coverage among 1 year olds in 2016.
- **PCV** has not yet been introduced in South Sudan.

- **$12** spent by the government on health per person in 2014.
- **4%** of the government’s budget spent on health in 2014.
- **1% of GDP** spent on health by the government in 2014.
- **54%** of total health expenditure is out-of-pocket.
